The Smith Meter® Model Universal Pulse Transmitter (UPT) is an infrared, quad-channel, high-resolution pulse generator driven by the output shaft of a positive displacement meter. It provides high-integrity pulse transmission and verification of signal and power for custody transfer measurement applications.

**Features**

- **Dual-Pulse (Quadrature) Output** for signal integrity checking and direction sensing.
- **Complementary Pulse Output** for power check.
- **Verification Pulse (Pulse per Revolution)** for independently checking signal transmission.
- **Explosion-Proof** Approved by UL, C-UL, ATEX, and IECEx.
- **Weather-Tight** – conforms to NEMA 4 requirements.

**Applications**

**Quadrature**

The Model UPT Transmitter provides a high-resolution pulse output whose integrity can be checked for pulse transmission errors resulting from induced noise, loss of transmitter power, malfunctioning transmitter, faulty transmission cable, etc. This is accomplished by interfacing the transmitted signals with a pulse sequence comparator device. Flow direction can also be detected with the appropriate instrumentation.

With the transmitter shaft turning in the counter-clockwise direction, the two pulse channels (A and B) are compared for a constant pulse stream...ABABAB... Each time the sequence is broken, and “AA” or “BB” occurs, an error signal is registered in the error signal circuitry. If the number of pulse transmission errors reaches a user-selected quantity, typically between 0 and 100, alarm functions built into the comparator device will be actuated when used with appropriate receiving equipment.

**Complementary Pulse Output**

The dual (Ā and B) complementary pulse output provides a check to compatible instrumentation for “power off” conditions. With electrical power to the UPT Transmitter, the “logic on” voltage and frequency of Ā and B will be a mirrored image of A and B, respectively, as shown in Figure 1 (Channel A is 180 electrical degrees out of phase with Channel Ā). If power is interrupted to the transmitter, the “logic on” voltage of A, Ā, B, and B will be 0 VDC.

**Principle of Operation**

The UPT Transmitter incorporates a state-of-the-art infrared emitter coupled through a rotating disk to a receiver array. This guarantees pulse tracking capability as the infrared emitter ages. The array detects the passage of slots on the disk, supplying the information to an application-specific integrated circuit board that converts them, by means of the self-contained electronic circuitry, into positive square wave output signals. Circuit design is such that the high-resolution pulse signals generated are approximately 90 degrees electrically out of phase. The pulse trains are compatible with all Smith Meter electronics.

As a normal function of the array, a verification pulse output is generated to provide one pulse per revolution of the input shaft.
Specifications

Electrical Characteristics

* For distances greater than listed above, contact factory and advise:
  - Type of instrument and if capacitive coupled.
  - Output frequency at maximum flow rate - pulses/second (Hz).
  - Transmission length.

Pulse Outputs

Type: Push-pull driver (current sink or current source, 20 mA / channel max).

Sourcing: Output voltage equal to input voltage minus a 2-volt (maximum) drop.

Sinking: Output voltage to within 0.5 volt of circuit common.

Duty Cycle: 50/50 nominal (may vary to 60/40 with temperature).

Phasing: Outputs A and A 180 degrees (±0.1%) out of phase; B and B 180 degrees (±0.1%) out of phase; verification pulse occurs on leading edge of the A pulse.

Quadrature separation between Outputs A and B (similarly A and B) 90 electrical degrees ±40 electrical degrees.

Verification Pulse

Type: Push-Pull driver (current sink or current source, 20 mA/channel maximum).

Sourcing: Output voltage equal to input voltage minus a 2-volt (maximum) drop.

Sinking Voltage: Output voltage to within 0.5 volt of circuit common.

Pulse Width: ≥ 47 milliseconds minimum at 300 RPM.

Note: Pulse width is inversely proportional to rotational rate.

Mechanical Characteristics

Operating Speed: 0-300 rpm (input revolutions).

Typical Running Torque: 14 inch oz.

Operating Temperature Range: -40°F to 158°F (-40°C to 70°C).

Approvals

North America UL/CUL

Ordering Information

The UPT Transmitter models available offer a variety of pulse rates (number of pulses per unit volume). It is important to select the proper model transmitter which, when mated with the particular driving meter, will provide the desired number of pulses per unit volume.

Pulse output per metered volume for the various transmitter models and various gearing can be determined from Table 1.
Modeling

**Type**

UPT - Universal Pulse Transmitter

**Housing**

XU - Explosion-Proof, UL/CUL, ATEX and IECEx

**High-Frequency Pulse Resolution**

1000 - 1,000 Pulses
500 - 500 Pulses
250 - 250 Pulses
200 - 200 Pulses
100 - 100 Pulses

**Input Coupling**

- 00 - S1 (E3 Through H8, E3-S3, S5)
- 01 - S3 and S5 (C2, F4 Through H8)
- 02 - S6 and S7 (C2 Through M16)
- 03 - S1, S3, and S5 (JA/JB10, K12, and M16)
- 04 - C2-S1 and SC-13 Gallons
- 05 - C2-S1 and SC-13 Dekalitres
- 06 - SD Meters and T-40 Gallons
- 07 - SD Meters and T-40 Dekalitres

**Special Application with Manual Calibrator**

For meters equipped with a manual calibrator, disregard input coupling. Instead of a coupling, provide UPT Adaptor Kit 529288-011.

---

8 For F4-S1 meters manufactured prior to 2008.
9 For F4-S1 meters manufactured 2008-present, also reference F4-S1 parts list P001006.
Dimensions

Inches (Millimeters)

Note: Dimensions – inches to the nearest tenth (millimeters to the nearest whole mm), each independently dimensioned from respective engineering drawings.
